Anthropic (Claude 3) Zero-Shot Method

Instructions:

User:

What can be done to help a blind person cross the street safely?

AI:

There are several ways to help a blind person cross the street safely:

1. Ask if they need assistance: Always ask the person if they would like help before assuming they need it. If they accept, ask how you can best assist them.
2. Use clear verbal instructions: Provide specific and clear directions, such as "The curb is about two steps in front of you" or "We'll be crossing to your left."
3. Offer your elbow: If the person accepts your assistance, offer your elbow for them to hold. This allows them to follow your movements and stay slightly behind you while crossing.
4. Be aware of their guide dog or cane: If the person has a guide dog or uses a cane, walk on the opposite side of the dog or cane.
5. Communicate obstacles and changes in terrain: Inform the person of any obstacles, steps, or changes in the walking surface as you approach them.
6. Use audible signals: Many crosswalks have audible signals that indicate when it is safe to cross. Help the person locate and use these signals if available.
7. Ensure the path is clear: Check that the path ahead is clear of obstacles and that there is sufficient time to cross safely before proceeding.
8. Don't leave abruptly: When you reach the other side, inform the person that you've completed the crossing and ask if they need any further assistance before leaving.

Remember, the key is to communicate clearly, be patient, and follow the person's lead on how they prefer to be assisted.
