Anthropic (Claude 3) Zero-Shot Method

Instructions:

User:

Many people smoke cigarettes every day in a specific green space and the cigarette smoke bothers the employees of the ground floor in the adjacent building. How can this problem be solved?

AI:

There are a few potential solutions to address the problem of cigarette smoke from a nearby green space bothering employees in an adjacent building:

1. Designate a smoking area: Work with the property manager or owner of the green space to designate a specific smoking area that is further away from the affected building. Provide clear signage and communicate the change to regular smokers.
2. Install air filtration systems: The affected building could install high-quality air filtration systems, particularly on the ground floor, to help remove smoke and improve indoor air quality.
3. Create a physical barrier: If feasible, a physical barrier such as a tall fence or hedge could be installed between the green space and the building to help block some of the smoke.
4. Implement a smoking ban: The property manager or local authorities could implement a smoking ban in the green space. This may be more challenging to enforce but could effectively eliminate the problem if successful.
5. Engage in dialogue: Representatives from the affected building could try to have a constructive dialogue with the smokers, explaining the impact of the smoke and politely requesting that they smoke elsewhere or dispose of cigarette butts properly.
6. Involve local authorities: If the problem persists, the affected building management could reach out to local authorities, such as the health department or environmental agency, to seek guidance or intervention.

The best solution will depend on the specific layout of the area, local laws and regulations, and the willingness of all parties to collaborate and compromise. A combination of measures may be necessary to effectively address the issue.
